

Problem Statement

Let's look at Python's input reading method.

```
>>> name = raw_input("Hey what's your name?\n")
Hey what's your name?
R2D2
>>> print name
R2D2
```

That's one way of doing it for yourself. But in competitive programming we don't ask questions. We only answer them. So we will only use `raw_input()` to read a string without asking any question to the system.

Task

Read a string from the console and print it.

Input Format

The first and only line of input contains a string.

Constraints

String length ≤ 500

Output Format

Print the same string back.

Sample Input

```
How many chickens does it take to cross the road?
```

Sample Output

```
How many chickens does it take to cross the road?
```
