

# What's Your Name?

## Problem Statement

Let's learn the basics of Python! You are given the first name and the last name of a person. Your task is to read them and print the following:

```
Hello firstname lastname! You just delved into python.
```

It's that simple!

In Python you can read a line as a string using

```
s = raw_input()
#here s reads the whole line.
```

**Input Format** The first line contains the first name, and the second line contains the last name.

## Constraints

The length of the first and last name  $\leq 10$ .

**Output Format** Print the output as mentioned above.

## Sample Input

```
Guido
Rossum
```

## Sample Output

```
Hello Guido Rossum! You just delved into python.
```

**Concept** The input read by the program is stored as a string data type. A string is a collection of characters.
